

Installing Ubuntu VM for RISC-V Development:

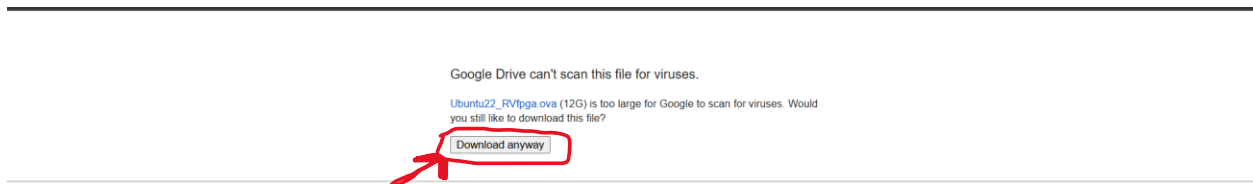

The provided Ubuntu VM with all the tools needed is present at the link:

https://drive.google.com/file/d/1KFnJYq6krB7vYt_AqTB_zTYVmxATwJF/view

Open the link, click on download:

Because the vm is pretty large you might encounter this warning:

Just click on “Download anyway”

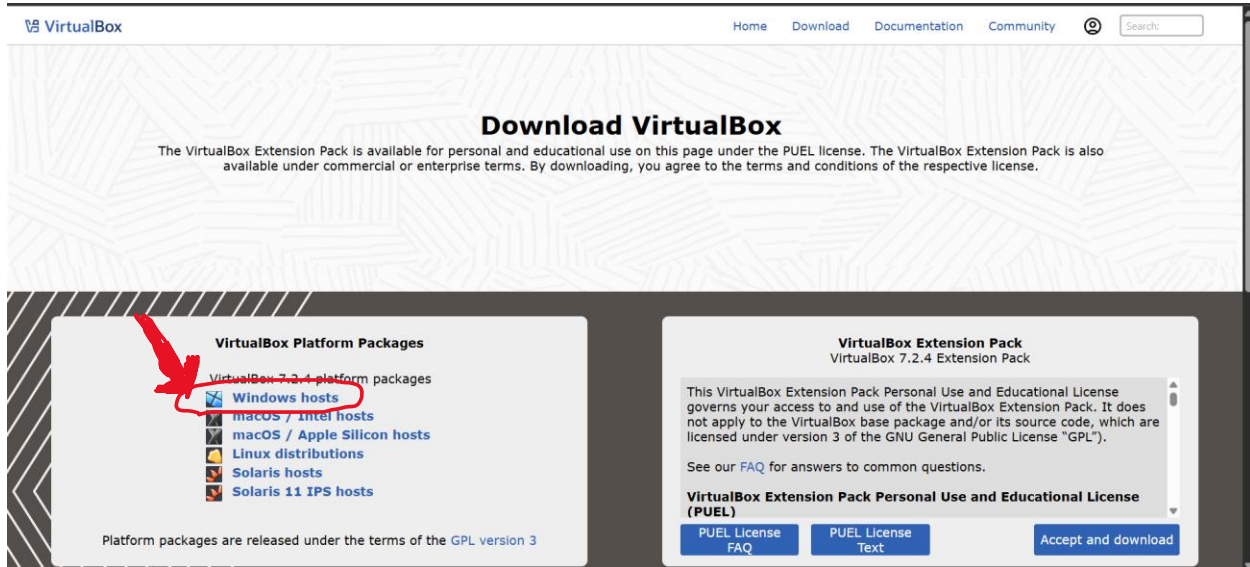

After the download is done, you’ll need a virtualization environment such as VirtualBox or VMWare.

Ensure you have the virtualization parameters enabled in BIOS before installing VirtualBox. Depending on your personal computer you have either of the following : VT-x / Virtualization Technology or AMD-V / SVM Mode. Make sure they’re enabled.

I'll exemplify how to install VirtualBox, so after you tweak the settings in bios head to:

<https://www.virtualbox.org/wiki/Downloads>

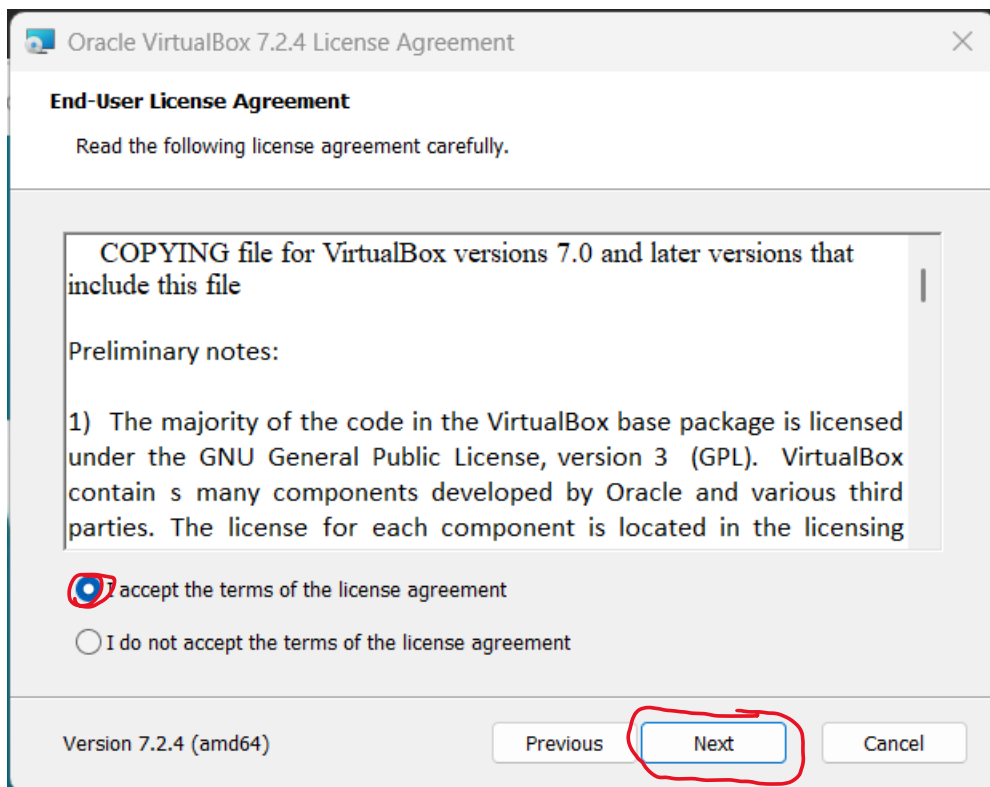

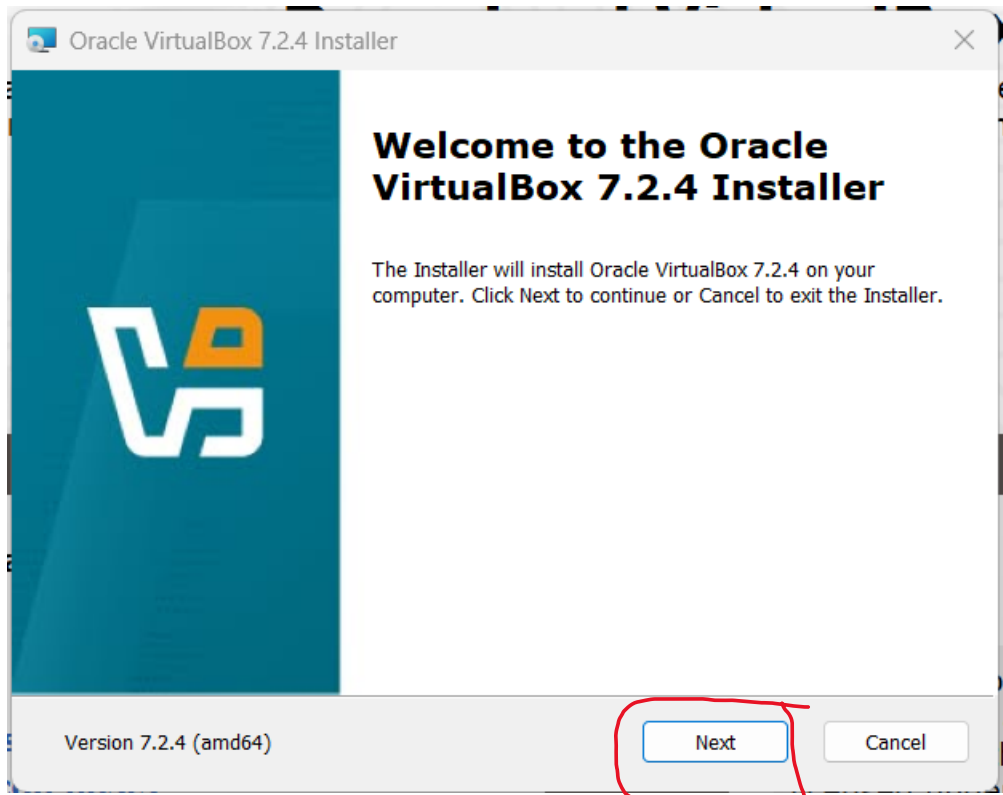

And download the latest version of VirtualBox.

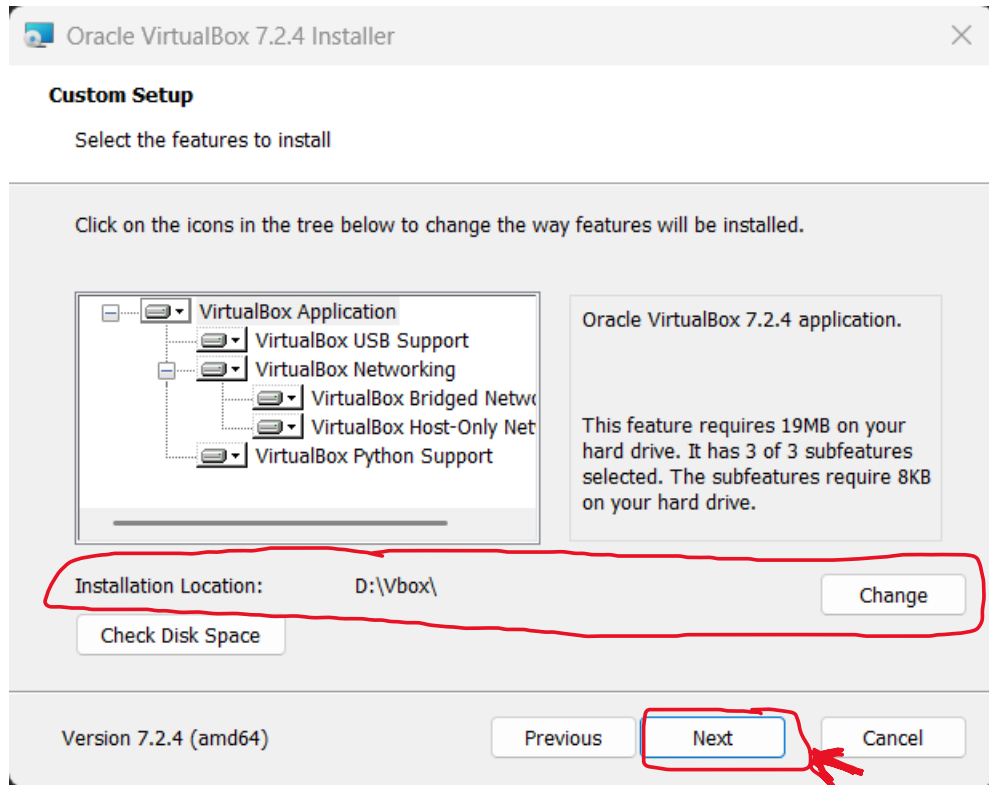

For Windows users you may want to click on “Windows hosts” button. For other OS refer to the documentation provided by VirtualBox for the downloading/installation process.

Example link for Debian based systems : <https://wiki.debian.org/VirtualBox>

After the download is complete run the setup.

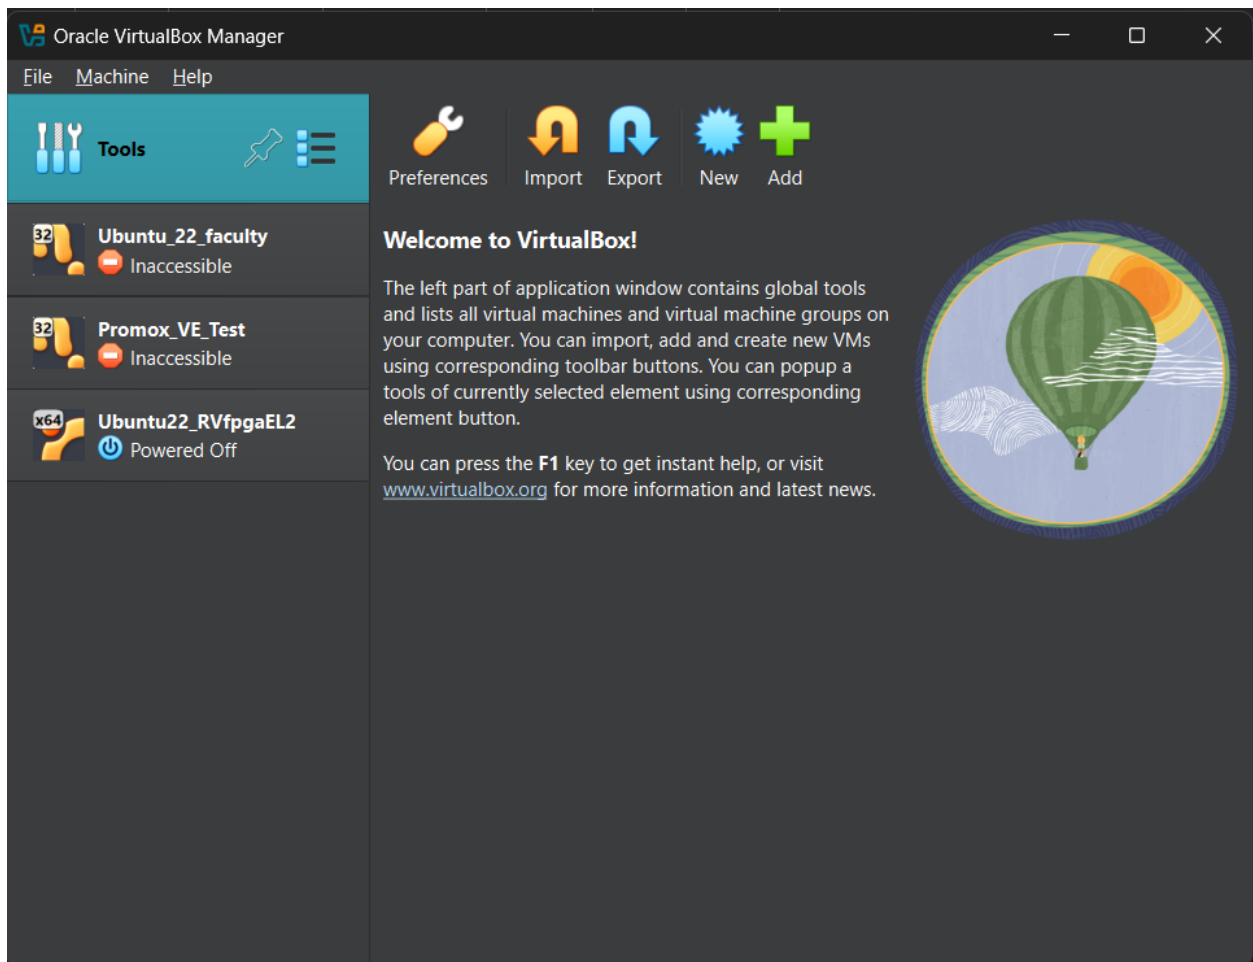

If you want to change the directory or any specifics about the installation or features here you do them, otherwise just click on next.

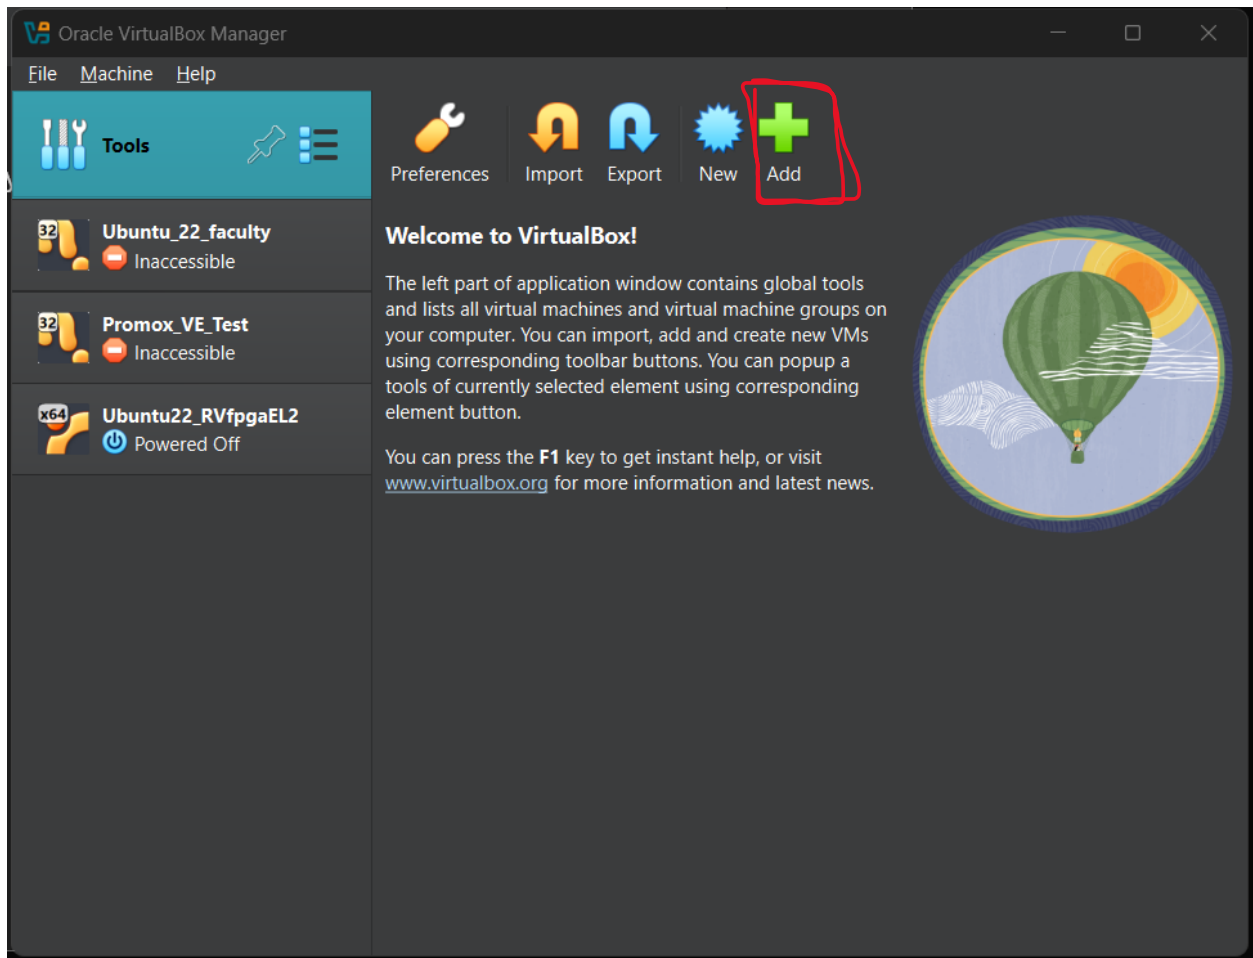

We leave everything as it is, just click “next” until the installation is done.

After installing and opening the VirtualBox we'll see something like this:

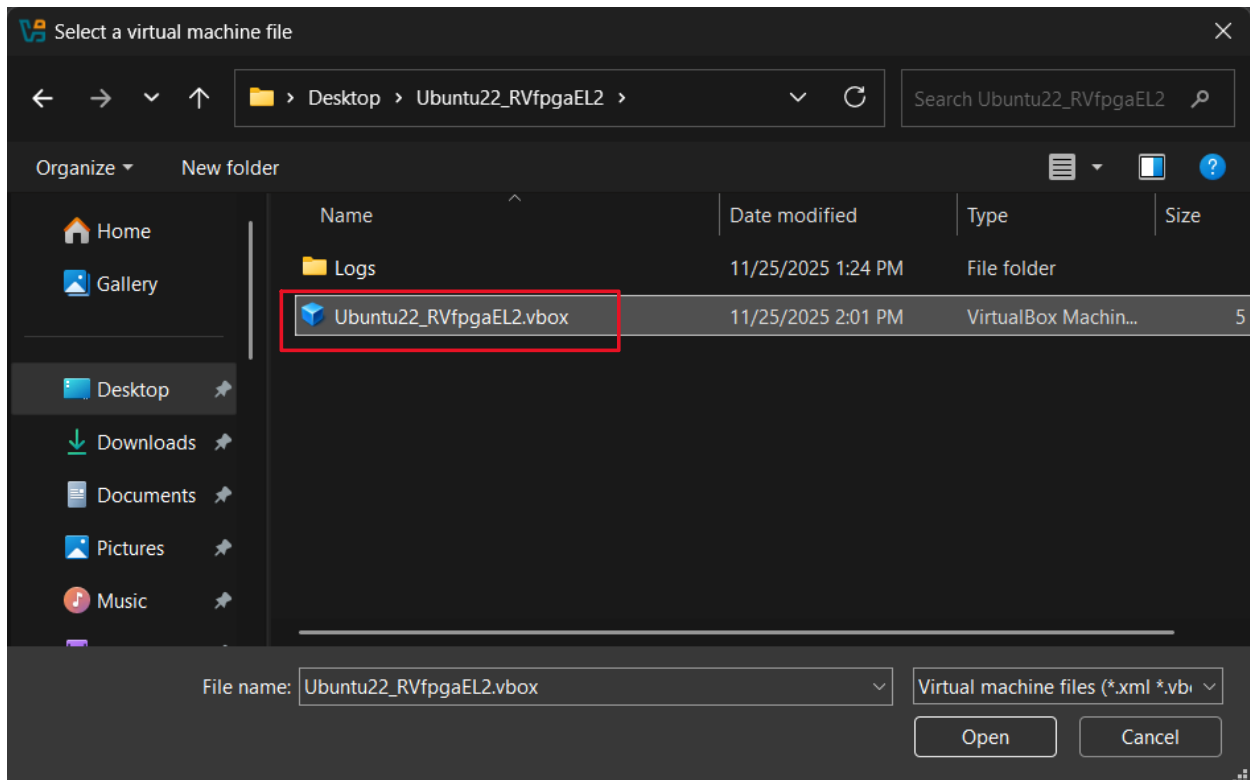

Excluding the three VMs that I already have settled up there.

Extract the VM zip, then we'll add the VM to VirtualBox.

Click on Add and find the VM folder where you extracted it.

Search for the Ubuntu22_RVfpgaEL2.vbox and open it.

After this we're pretty much done, assign it preferably at least 4 GB of ram if you are asked to and you're set.

Now you can open the machine by double clicking the machine on the left side or by clicking once on it and clicking start on the right side
